ABSTRACT

The uptake of nitrogen and phosphorus increased with increase in the level of nitrogen and phosphorus in daisy (*Aster amellus* L.) upto 200 kg ha^{-1} and 125 kg ha^{-1}, respectively. The highest nitrogen and phosphorus uptake were recorded by N_3 and P_3 levels individually and in combination. However, the flower yield in terms of number of flower spikes per plant was the highest with N_2 and P_2 levels.

Key words : Daisy, Nitrogen, Phosphorus, Uptake
